

MICROPREFS® MICROPLASTICS REFERENCE MATERIALS

ENVIRONMENTAL

Setting the Standard in Microplastics Testing with Chiron MicroPRefs®

Microplastics are plastic particles smaller than 5 millimeters that have become widespread environmental pollutants. These non-biodegradable particles accumulate in ecosystems and can enter the food and beverage supply, making them harmful to both the environment and human health.

To support accurate analysis, our scientists developed MicroPRefs® microplastics reference materials. Designed to detect the six most abundant plastics, they are available in two formats: a novel, easy-to-use soda tablet, and neat powder.

Chiron MicroPRefs® Features:

- Available polymers: PE, PP, PS, PET, PVC, and PC
- Particle size: 50-300 µm with irregular shapes that reflect real-world environmental samples
- Soda tablets: Ideal for particle counting and polymer identification by Optical Microscope, µ-FTIR, µ-Raman, LDIR
- Neat (powder) form: Optimized for polymer identification and purity analysis by Pyr-GC/MS or TED-GC/MS
